

DeepSec 2016 – expect 48 Hours of Failures and Fixes in Information Security

Posted on **November 10,2016** by **lynx**

The conference part of DeepSec 2016 has officially started. During the workshops we already discussed a lot of challenges (to phrase it lightly) for infrastructure and all kinds of software alike. The Internet of Things (IoT) has only delivered major flaws and gigantic Distributed Denial of Service attacks so far. There is even a [worm for LEDs](#) these days. And we haven't started the conference preparations yet.

So we have plenty of reasons to talk about what went wrong, what will go wrong, and what we can do about it. The world of information security is not always about good news. Something has to break, before it can be repaired – usually. Systems administrators know this, for some it's their daily routine. Nevertheless we hope everyone at DeepSec gets some new insights, fresh ideas, and more ways to tackle the Wonderful World of Information Security. We can't wait to see the presentations!

Enjoy the conference!
